1.13	NSR13 – Craiglaw.....	14
1.14	NSR14 – Hopehead	15

1.0 Introduction

This Technical Appendix provides the detailed calculation results of the predicted wind turbine noise immission level at each of the Noise Sensitive Receptors (NSRs). Set out subsequently for each NSR is the following information both in tabular and graphical format:

- The overall ETSU-R-97 noise limits for the daytime (shown graphically as a solid black line) and night-time (shown graphically as a solid blue line);
- The cumulative total wind turbine noise (shown graphically as a solid red line) incorporating all of the subsequent wind farm noise immission levels;
- The Proposed Development wind turbine noise (shown graphically as a dashed red line);
- Clyde Wind Farm immission level (shown graphically as a dashed sand line);
- Clyde Wind Farm Extension immission level (shown graphically as a dot-dashed sand line);
- Glenkerie Wind Farm immission level (shown graphically as a dashed blue line);
- Glenkerie Extension Wind Farm immission level (shown graphically as a dot-dashed blue line);
- Grayside Wind Farm immission level (shown graphically as a dashed grey line);
- Whitelaw Brae Wind Farm immission level (shown graphically as a dashed green line);
- The margin between the cumulative total wind turbine noise and the ETSU-R-97 daytime limit (shown in the tables only); and
- The margin between the cumulative total wind turbine noise and the ETSU-R-97 night-time limit (shown in the tables only).

The predicted noise immission levels from all neighbouring wind farms to the Proposed Development include the appropriate uplift as discussed in Chapter 13 of the EIA Report. It should be noted that all calculations have been carried out to one decimal place and the results shown to the nearest whole decibel. Therefore, in some cases the margin may not exactly equal the difference between the limit and cumulative immission presented: e.g. NSR01 at 8 m/s day limit is 43.2 dB (43 dB presented), cumulative immission is 39.5 dB (40 dB presented), giving a margin of -3.7 dB (4 dB presented; however, 3 dB may be expected if the rounded values are used).
